

## Claims

- [c1] 1.A computer implemented method for providing system security and resource management, comprising:
- managing event messages by a master control processor between system handlers according to security system policies;
  - processing network messages by a network handler between client and server computers;
  - inserting native and third party event messages received by an insertion handler into the master control processor for processing by other system handlers;
  - detecting and processing event message signatures by the signature handler from alarm, system, and insertion events for conversion into system alarm messages for action by the other system handlers; and
  - performing actions by an action handler in response to action requests from the master control processor.
- [c2] 2.The method according to claim 1, further comprising maintaining an execution environment by an agent handler for mobile autonomous code modules.
- [c3] 3.The method according to claim 1, further comprising collecting and logging event messages by a logging handler.
- [c4] 4.The method according to claim 1, further comprising managing system configuration parameters by a configuration handler.
- [c5] 5.The method according to claim 1, wherein the step of managing event messages comprises:
- registering the system handlers;
  - passing event messages between system handlers; and
  - managing a event queues attached to the system handlers.
- [c6] 6.The method according to claim 5, wherein the step of registering each system handler comprises:
- reading the handler module to determine initialization requirement;

initializing the handler application programming interface;  
determining if the handler is to run as a remote procedure call;  
making the handler available through the remote procedure call interface  
if run as a remote procedure call; and  
initializing the handler input/output queues if not run as a remote  
procedure call.

[c7] 7.The method according to claim 1, wherein the system handlers comprise  
static and dynamic system processes.

[c8] 8.The method according to claim 1, further comprising;  
initiating the system handlers by internal mechanisms;  
initiating the system handlers by external mechanisms; and  
initiating the system handlers from the master control processor.

[c9] 9.The method according to claim 1, wherein the system handlers have a  
reversible architecture to enable the system handlers to be used in either a  
client or server computer mode.

[c10] 10.The method according to claim 1, wherein the step of processing network  
messages by the network handler comprises:  
allowing connection only from clients and servers defined in a access  
control list;  
authenticating protocols with clients and servers;  
compressing data to minimize bandwidth requirements; and  
encrypting data to provide secure communication.

[c11] 11.The method according to claim 1, wherein the step of inserting native and  
third party event messages received by the insertion handler from external  
programs comprises:  
reading and writing messages using an insertion method selected from  
the group consisting of file descriptor, network sockets and named pipe;  
using a native insertion mode library to directly insert messages into the  
master control processor; and  
using an external insertion mode library linked to a third party sources to

directly insert messages into the master control processor.

[c12]

12.The method according to claim 1, wherein the step of detecting and processing event messages received by the signature handler comprises:

- accepting alarm events from the master control processor;
- decoding the alarm type and originator from the alarm event;
- consulting internal signature registry for alarms of the type accepted;
- handing the alarm message off to the signature module for processing;
- extracting alarm data macro information;
- determining if an alarm has occurred;
- consulting the action policy if an alarm has occurred to determine response; and
- passing the resulting response message to the master control processor for action by the other system handlers.

[c13]

13.The method according to claim 1, wherein the action performed by the action handler is selected from the group consisting of blocking a host with a modified route command, blocking a host with a packet filter modification command, disabling a user account, disabling a network interface, running an external user-defined command, logging an event, sending email or pager alerts, sending on-screen alerts to users or administrators, requesting server executed action, and a pluggable action defined by a user.

[c14]

14.The method according to claim 1, wherein the steps of detecting and processing event messages received by the signature handler and performing actions by the action handler comprises the steps of:

- receiving an event message containing a signature by the signature handler from the master control processor;
- detecting an attack by the signature handler from the event message signature;
- consulting action policy by the signature handler;
- determining action to be taken by the signature handler;
- ending the process if no action is required;
- determining required action parameters by the signature handler if action

is required;

sending an action request to the action handler by the signature handler  
via the master control processor;

processing and executing the action request by the action handler; and

returning status of the executed action to the signature handler.

[c15]

15.The method according to claim 2, wherein the step of maintaining an  
execution environment by the agent handler for mobile autonomous code  
modules comprises:

ensuring that the mobile autonomous code modules carry appropriate  
credentials, are authenticated and cryptographically signed by a trusted  
introducer, and able to execute on the host operating system;

distributing mobile autonomous code modules to one or more client  
computers;

executing the mobile autonomous code modules without interference;

allowing the mobile autonomous code modules to collect and report its  
results; and

shutting down the mobile autonomous code modules.

[c16]

16.The method according to claim 15, wherein the step of executing the mobile  
autonomous code modules comprises:

verifying detected alarms;

reducing false alarm rates; and

providing immediate response.

[c17]

17.The method according to claim 15, wherein the step of executing the mobile  
autonomous code modules comprises the steps of actively looking for problems  
and identifying attackers when problems are detected.

[c18]

18.The method according to claim 15, wherein the step of executing the mobile  
autonomous code modules comprises performing security and system  
administration tasks in self-healing network environments.

[c19]

19.The method according to claim 15, wherein the step of executing the mobile  
autonomous code modules comprises allowing self-healing components of the

system to move between clients and operate independently where required.

[c20] 20.The method according to claim 2, wherein the step of maintaining an execution environment by the agent handler for mobile autonomous code modules comprises:

- enabling self-healing and adaptive networks;
- facilitating distribution of updates for the mobile autonomous code modules; and
- centralizing command and control functions for increased reliability.

[c21] 21.The method according to claim 2, wherein the step of maintaining an execution environment by the agent handler further comprises forming a peer-to-peer defensive cluster with mobile autonomous code modules.

[c22] 22.The method according to claim 2, wherein the step of maintaining an execution environment by the agent handler further comprises protecting the mobile autonomous code modules from alteration or tampering by hostile adversaries, and dispatching the mobile autonomous code modules through a predictable schedule from a central control point.

[c23] 23.The method of claim 22, wherein the mobile autonomous code modules are dispatched through a random schedule.

[c24] 24.The method according to claim 2, wherein the step of maintaining an execution environment by the agent handler further comprises:

- programming the mobile autonomous code modules to detect and remove attackers at random;
- storing code for the mobile autonomous code modules at a central location;
- preventing alteration of the mobile autonomous code modules on client computers;
- updating the mobile autonomous code modules with updated security detection strategies without modifying client computers;
- beginning an active search for attackers when alerted to an intruder's presence;

performing automated corrective measures to remove the intruder; and  
saving forensic evidence.

[c25] 25.The method according to claim 2, wherein security-specific mobile autonomous code modules are selected from the group consisting of forensic evidence agent, intrusion control agent, file integrity agent, host scanning agent, known intrusion agent, loadable kernel module agent, password cracking agent, log archive agent, rootkit agent, suspicious file agent, promiscuous mode agent, hidden process detection agent, unauthorized network daemon agent, self-test agent, spy agent, zombie shells agent, and insider attack agent.

[c26] 26.The method according to claim 25, wherein forensic evidence gathered by the forensic evidence agent from protected systems is cryptographically signed to prevent tampering.

[c27] 27.The method according to claim 2, wherein network management-specific mobile autonomous code modules are selected from the group consisting of backup agent, host inventory agent, system monitor and status agent, system task agent, and PPatchWatch agent

[c28] 28.The method according to claim 3, wherein the method of logging event messages is selected from the group consisting of text-based files, a local system auditing facility, a cryptographically signed secure log format, directly to a system console, e-mail notification, direct used interface, and system wide notification.

[c29] 29.The method according to claim 4, wherein the step of managing system configuration parameters comprises;

- interfacing generic calls to other system handlers;
- reading system configuration parameters;
- writing system configuration parameters;
- changing system configuration parameters;
- reverting system configuration parameters back to a previous version;
- deleting system configuration parameters;
- backing up system configuration parameters; and

providing multiple access protection mechanisms.

- [c30] 30.A system for providing system security and resource management, comprising:
- a master control processor for managing event messages between system handlers according to security system policies;
  - a network handler for processing network messages between client and server computers;
  - an insertion handler for inserting native and third party event messages into the master control processor for processing by other system handlers;
  - a signature handler for detecting and processing event messages from alarm, system, and insertion events for conversion into system alarm messages for action by other system handlers; and
  - an action handler for performing actions in response to action requests from the master control processor.

- [c31] 31.The system according to claim 30, further comprising:
- an agent handler for maintaining an execution environment for mobile autonomous code modules;
  - a logging handler for collecting and logging event messages; and
  - a configuration handler for managing system configuration parameters.

- [c32] 32.The system according to claim 31, wherein the system handlers auto-register themselves and their capabilities with the master control processor.

- [c33] 33.The system according to claim 30, wherein the action handler utilizes pluggable action modules.

- [c34] 34.The system according to claim 30, wherein the signature handler utilizes pluggable signature modules.

- [c35] 35.The system according to claim 34, wherein the pluggable signature modules auto-register with the signature handler.

- [c36] 36.The system according to claim 34, wherein a pluggable signature modules

uses stored data from other signature modules, stores data between execution, stores data between system startup and shutdown sequences, and only processes signatures relating to the signature module.

- [c37] 37.The system according to claim 34, wherein the pluggable signature modules are added and removed from the system without modifying the core system code.
- [c38] 38.The system according to claim 31, wherein the system is installed on at least one server computer and at least one client computer.
- [c39] 39.The system according to claim 38, wherein the system installed on at least one client operates independently of the system installed on at least one server for reduced processing and reaction time and when network communications are disrupted.
- [c40] 40.The system according to claim 38, further comprising at least one graphical user interface.
- [c41] 41.The system according to claim 40, further comprising multiple levels of independent alarm filters on the client and server computers for reduced false alarm reporting, configuration flexibility, and system granularity.
- [c42] 42.The system according to claim 40, further comprising encrypted and mutually authenticated communication links between the server computer, client computer and graphical user interface.
- [c43] 43.The system according to claim 40, further comprising a means for re-allocating system resources to circumvent system problems or failures.
- [c44] 44.The system according to claim 31, wherein the system is installed on a client computer to maintain host processes, collect and forward events, process local client signatures, generate events, initiate and respond to action requests, initiate self-healing counter-measures, and host mobile autonomous code agents.
- [c45] 45.The system according to claim 31, wherein the system is installed on a

server computer to collect and store events, process enterprise client signatures, generate events, operate a central system database, schedule events, initiate and respond to action requests, initiate self-healing counter-measures, maintain a graphical user interface backend structure, and manage mobile autonomous code agents.

- [c46] 46.The system according to claim 40, wherein the client computer has a capability to perform server computer functions in the event of failure of a server computer.
- [c47] 47.The system according to claim 40, wherein the server computer has a capability to perform client computer functions in the event of failure of a client computer.
- [c48] 48.Computer executable software code stored on a computer readable medium, the code for a computer implemented method for providing system security and resource management, comprising:
- code for managing event messages by a master control processor between system handlers according to security system policies;
  - code for processing network messages by a network handler between client and server computers;
  - code for inserting native and third party event messages received by an insertion handler into the master control processor for processing by other system handlers;
  - code for detecting and processing event message signatures by the signature handler from alarm, system, and insertion events for conversion into system alarm messages for action by the other system handlers; and
  - code for performing actions by an action handler in response to action requests from the master control processor.
- [c49] 49.The computer executable software code method of claim 48, further comprising:
- code for maintaining an execution environment by an agent handler for mobile autonomous code modules;
  - code for collecting and logging event messages by a logging handler; and

code for managing system configuration parameters by a configuration handler.
